

REACT NATIVE

Introduction

React Native

HIENTH

Hybrid and Native Application

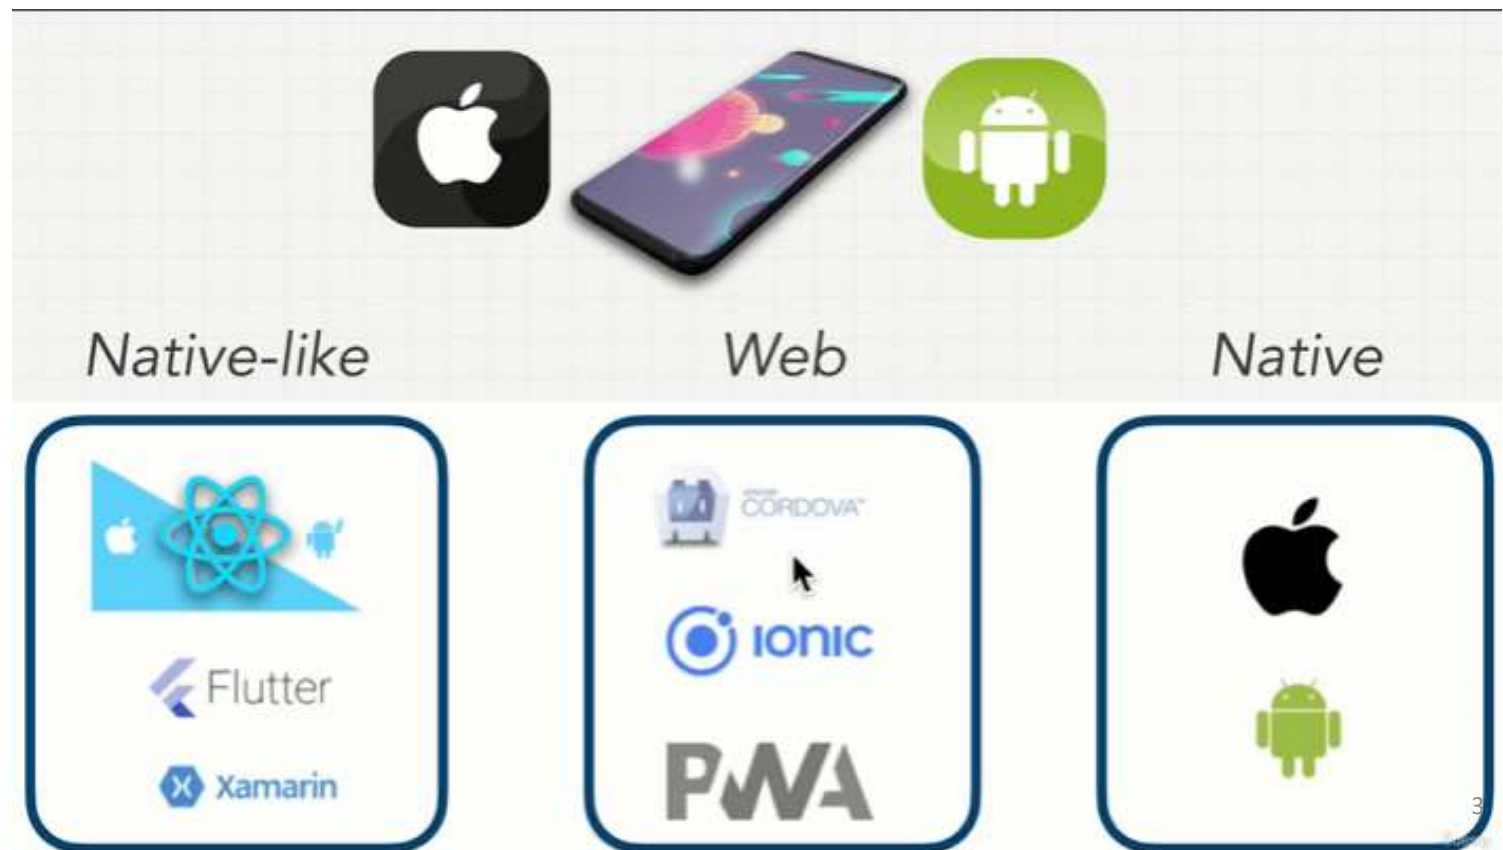

- Hybrid
 - Is written base on web platform (html, css, javascript)
 - Is purely web application
 - Added features to manipulate operating system like access file, camera, GPS, using PhoneGap/Cordova
- Native
 - Is developed directly in the language of operating system provided (Objective C, Swift, Java, C++, C#)
 - Have all the features that the operating system provides
 - The speed is fastest

Flutter vs React Native

Flutter vs React Native: Which is the Best for Mobile App Development in 2022?

<https://apexlabs.ai/post/flutter-vs-react-native>

What Is React Native?

- JavaScript framework for building iOS and Android mobile apps.
- Based on popular JavaScript Web framework called React.
- Created by Facebook. Firstly release iOS version on March 2015 and Android version on September 2015
- Writing the app by using JavaScript and XML-esque markup (JSX)
- React-Native bridges and invokes the Native rendering API in Objective-C (iOS) and Java (Android)

Approach of Mobile App Dev

Approach	Platform	Logic	UI	UX	Dev Time*
Native	Object C, Swift (iOS), Java (Android)	Native	Native	Smooth	6-24 weeks
HTML5 Hybrid	PhoneGap, Cordova, Ionic	JS	HTML, CSS	Laggy	2-8 weeks
Native Hybrid	React Native, NativeScript	JS	Native	Smooth	2-8 weeks

- * 20-30 screens mobile apps approximated based on instructor experiences

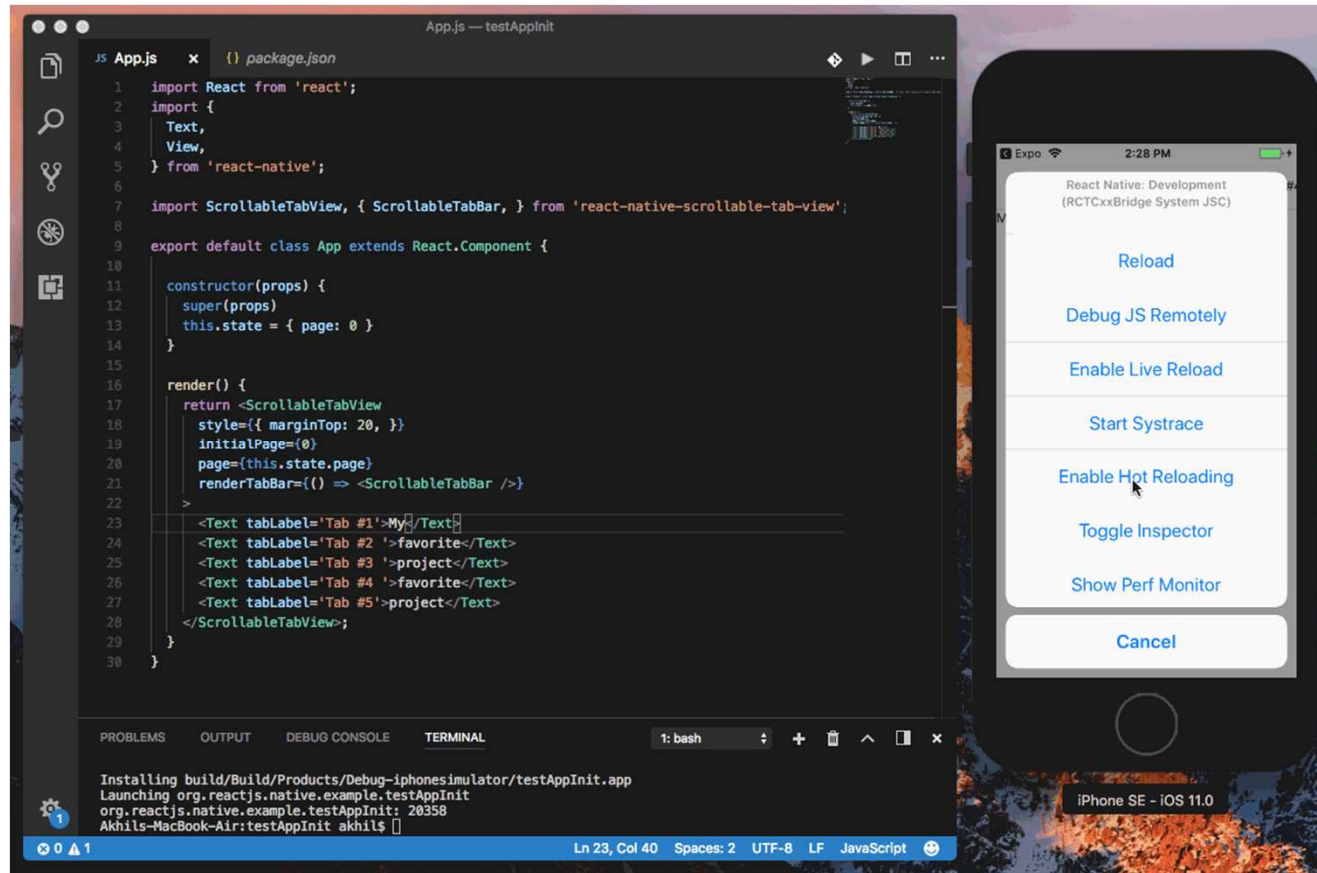

Why React Native?

- Native Experience
- One language rules them all, JavaScript.
- Fast & Great Development Experience
 - Don't Waste Time Recompiling (Hot Reloading)
 - 80% Share code between Android & iOS
 - Great Debugging Tool using Chrome Developer Tools
- Be able to bridge with Native Code when we need to.

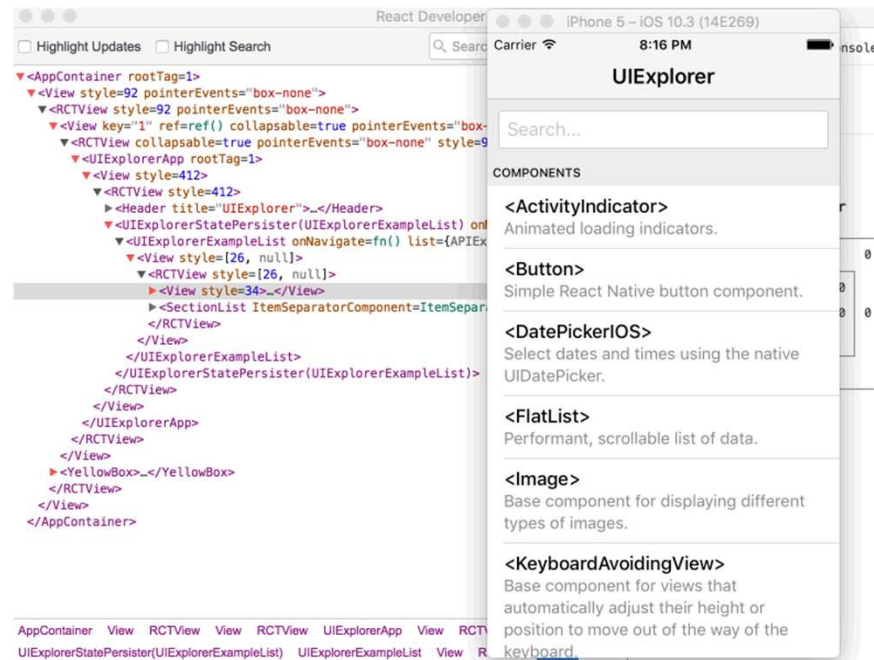

Native Experience

HIENLTH

Hot Reloading

Debugging With Chrome Developer Tools

Why not React Native?

- React-Native is still relatively young compared with Native iOS and Android Communities (Released on 2015)
- Some of Native API still are not supported. (But you can use the native libraries through)
- Add one additional layer to mobile app project

What Is React?

- Declarative, Efficient, and Flexible JavaScript Library that Building User Interface on Website
- React Native is rooted from React
- React treats every thing as a Component

```
class ShoppingList extends React.Component {  
  render() {  
    return (  
      <div className="shopping-list">  
        <h1>Shopping List for {this.props.name}</h1>  
        <ul>  
          <li>Instagram</li>  
          <li>WhatsApp</li>  
          <li>Oculus</li>  
        </ul>  
      </div>  
    );  
  }  
}
```

- A React Component

Prerequisites

- Javascript, preferably ES6/ES2015
- Knowledge of how to use the command line
- Basic understanding of npm & how it works

References

- <https://reactnative.dev>
- <https://docs.expo.dev/index.html>

*Thank
you!*

Exercise 1

- Register Expo account: <https://expo.dev>
- Install App Expo in local machine (to Run your application)
<https://expo.dev/client>
- Prepare environment for coding:
<https://reactnative.dev/docs/environment-setup>
 - Visual Studio Code [optional]
 - NodeJs <https://nodejs.org/en/> (choose **LTS** version, check \$ **node --version**)
 - Expo CLI: Input command \$ **npm install -g expo-cli**

Exercise 2

- Build a simple mobile app using SNACK EXPO:
 - Open the page <https://snack.expo.dev/>
 - Create a new GUI that has your information, includeing **fullname, phone, student id, email, hobbies, ...**
 - Install Expo GO on mobile [iOS/Android]
 - Open Expo GO app, scan QR code, run and take screen
 - Report all actions and submit to LMS
